

# Housing: model and data

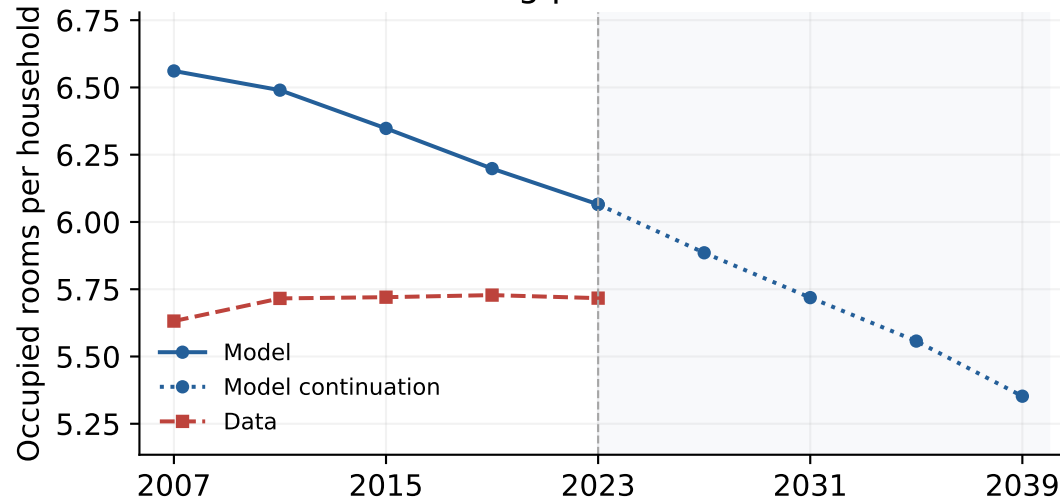

## Households

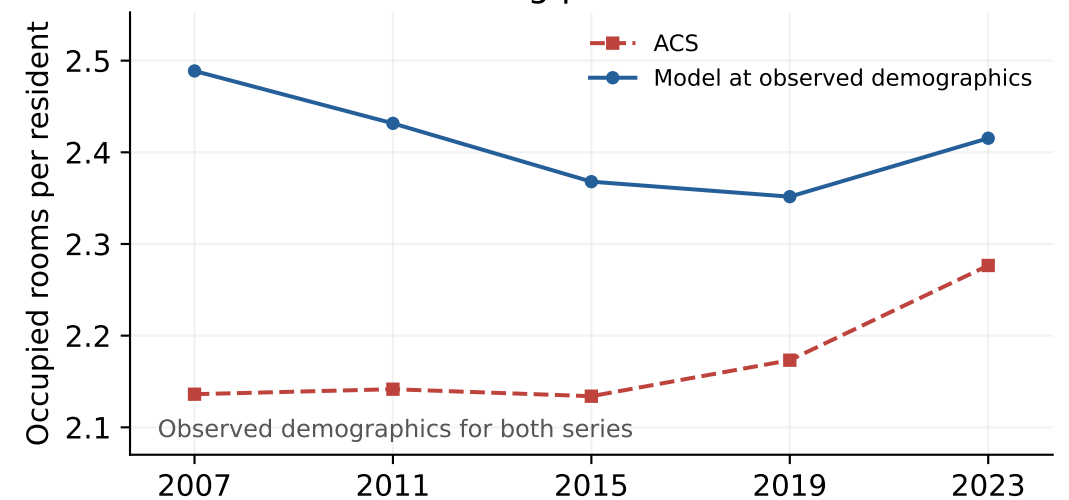

## Total occupied housing

## Housing per household

## Housing per resident

Data: national ACS occupied households, heads ages 18–85; rooms capped at nine. Household weights for housing, person weights for residents.  
 Top row: native model aggregates; historical household counts use Census inputs, whose coverage differs from the restricted ACS sample.  
 Bottom right: model rooms per household  $\times$  ACS households / ACS residents; a comparison at common demographics, not a population prediction.  
 Model resident-person history is unavailable before 2023. Dotted continuation holds preferences fixed; no tax rebate, horizon sensitivity unresolved.
