

Quantitative model

Verified history and model fit

September 13, 2026, 12:56 UTC | Six-period history verified; policies and longer horizons continue.

The fiscal and distribution repairs pass. The economic fit remains weak. The corrected initial equilibrium reproduces exactly in two independent numerical repetitions. Its objective is 179.298424. This is a verified candidate from an incomplete search, not a converged calibration optimizer.

Question	Verified evidence
Does the pension budget balance?	Yes in the initial equilibrium and every accepted historical forecast date.
Is property tax rebated?	Yes. Revenue returns equally per current household head; the rebate budget is checked separately from pensions.
Was the probability error fixed?	Yes. Float64 normalization in both Markov distribution operators passes the captured mass-error replay and full initial reconstruction.
Is the entire shock path fitted?	Yes for the provisional six-period A0 history. All four observed fertility windows pass the 0.005 fit requirement. Horizon adequacy remains unverified.
Are policy results ready?	Not yet. Baseline and higher-tax rebated policies follow each completed history from its inherited 2023 households.

What deserves attention

Mean rooms and ownership at ages 30-55 are the largest remaining fit problems. Annual beta reaches its 0.99 cap. The numerical repair changes the objective by less than one millionth; it is not evidence of improved economic fit.

The 6-, 24- and 100-period forecasts are separate horizon checks. Passing a finite market-clearing root does not establish that a shorter horizon is adequate. The alternative demographic closure remains unresolved and has not been promoted.

How the historical exercise works

At each surprise, households expect the new fertility preference to remain constant. For guessed paths of house prices, pensions and rebates, the solver works backward over household choices and forward over inherited households. It adjusts those paths until markets and both fiscal budgets clear, then adjusts the preference to match that observation window. Only the first realized period is carried to the next surprise.

Complete initial target fit

All 13 retained rows: 12 scored moments and the separate completed-fertility normalization. Objective 179.298424. The target system and weights are unchanged.

Moment	Target	Model	Gap	Weight	Loss
Initial model completed fertility	2.1	2.1	8.22549e-07	-	-
Childless women, ages 40–44	0.198279	0.196258	-0.00202037	35532.3	0.145039
Exactly one child among mothers, ages 40–44	0.213655	0.216439	0.00278364	26952.8	0.208848
Period mean first-birth age	25.9763	26.0952	0.118982	139.828	1.9795
First births at age 30+	0.249278	0.232155	-0.0171228	13866.1	4.06539
Wealth / annual gross labor earnings	6.14586	4.89343	-1.25243	7.5951	11.9136
Annual bequests / aggregate wealth	0.0088	0.00858241	-0.000217591	5.16529e+06	0.244554
Old wealth/income p90 / median, ages 76–84	3.51594	4.4998	0.983865	10.6164	10.2765
Mean occupied rooms, capped at 9	5.5611	6.42465	0.863555	128.021	95.4685
Ownership, heads 30–55	0.648334	0.539896	-0.108438	2339.36	27.508
First-birth room response, -1 to +3	0.720246	0.980806	0.26056	137.565	9.3395
Rooms: 3+ versus 1–2 resident children (model dependent proxy)	0.347067	0.172043	-0.175024	280.528	8.59354
Recent-parent ownership gap	0.162896	0.144103	-0.0187928	27055.8	9.55533

The normalization row does not enter the loss. Units follow each empirical moment: ownership is a fraction, room responses are in rooms, and first-birth age is in years. The CSV preserves every row's builder, sample, vintage, observation definition, uncertainty and weighting provenance.

Interpretation

Initial fertility levels are close by construction and the fertility-composition moments fit relatively well. Mean rooms are too high and ownership is too low. The first-birth room response overshoots its target. A numerically valid equilibrium therefore does not imply an adequate fit across the housing mechanisms.

Historical observation clock

Decision vintage	Observed TFR window	Target
2007	2008-2011	1.974875
2011	2012-2015	1.861000
2015	2016-2019	1.755375
2019	2020-2023	1.645750

A 2023 decision-vintage fertility flow belongs to the 2024-2027 forecast. It is not an additional fitted historical observation. Other 2023 model/data comparisons must use the correctly dated inherited economy.

Verified four-window history

All four fertility windows are matched in a six-period forecast. Each accepted date passes housing, PAYGO and equal-rebate gates. Horizon adequacy remains unverified; longer runs and rebated-tax policies continue. Matching the fertility decline does not resolve weak cross-sectional fit.

Window end	Data	Model	Gap	psi
2011	1.97487	1.97312	-0.00175075	0.128915
2015	1.861	1.86104	4.20102e-05	0.116966
2019	1.75537	1.75534	-3.68441e-05	0.105643
2023	1.64575	1.64556	-0.000190682	0.0922185

Full 2023 validation: Data / Model (untargeted)

These comparisons are a validation readout; they are not additional fitted targets.

2023 validation measurement caveats

Completed fertility, ages 40–44. Children ever born stock; distinct from period fertility.

Mean age at first birth (years). Model 2024–2027 flow versus annual 2023 NCHS births.

First births at age 30+ (%). Model 2024–2027 flow versus annual 2023 NCHS births.

First-birth room response, –1 to +3. Sun–Abraham empirical contrast; model matched branch from 2019 into 2023.

Rooms: 3+ versus 1–2 resident children. Model dependent counts proxy resident own children under 18.

Recent-parent ownership gap (pp). Model current birth into an empty dependent home versus currently empty home; retained flow proxy, not exact ACS oldest-child-age reconstruction.

Annual bequests / wealth (%). External historical restriction; not a 2023 observation.

Wealth/income p90 / median, ages 76–84. Beginning-period wealth of living households; model pension-income proxy versus empirical family income.

Parameters and restrictions

Nine structural search coordinates. The other rows are fixed restrictions, normalizations or endogenous fiscal outcomes; they are not additional structural estimates.

Parameter	Value	Lower	Upper	Near bound	Search
beta_annual	0.99	0.94	0.99	Yes	Yes
kappa_fert	0.337734	0.02	50	Yes	Yes
kappa_fert_continuation	0.397856	0.02	50	Yes	Yes
chi	1.04965	0.1	5	No	Yes
H0	8.1121	0.2	80	No	Yes
theta0	0.081051	0	8	No	Yes
theta1	0.0852036	0.02	16	Yes	Yes
first_birth_fixed_cost	0.265765	0	8	No	Yes
h_P	2.3	0.1	2.3	Yes	Yes
hbar_child_rooms	0	-	-	No	No
psi_child	0.148915	-	-	No	No
payroll_tax	0.179	-	-	No	No
pension_period	2.04636	-	-	No	No
housing_supply_elasticity	0.63	-	-	No	No
tenure_choice_kappa	0.005	-	-	No	No
alpha_cons	0.733	-	-	No	No
sigma	2	-	-	No	No

The annual-beta upper bound is the enforced 0.99. The scorer's older metadata is preserved in parameters_raw.csv. Near-bound flags use the retained reporting rule and should not be read as proof of binding first-order conditions.

Numerical acceptance evidence

Initial check	Observed value
Stationary nesting, L1	2.2747454e-14
One-period nesting, L1	2.6512812e-13
PAYGO relative budget gap	3.0689413e-12
Equal-rebate relative budget gap	3.8384145e-7
Second numerical signature	Exactly equal
