

Stationary property-tax comparison

September 12, 2026 | Same structural calibration and fertility preference in every case

Outcome	1% tax No rebate	1% tax Equal rebate	2% tax Equal rebate
Period fertility	1.7298	1.8011	1.8080
Homeownership (%)	66.31	66.13	66.80
Rooms per household	6.7337	6.6256	6.2977
House price per room	0.6331	0.7072	0.6594
Period rent per room	0.1049	0.1172	0.1356
Period rebate per household	0.0000	0.1874	0.3322
Period pension benefit	1.5629	1.5658	1.5660
Property-tax revenue (model scale)	0.158881	0.190315	0.339586
Equal-rebate outlays (model scale)	0.000000	0.190315	0.339586
Households with dependents (%)	31.60	32.70	32.82
Births per household per period	0.0834	0.0866	0.0868
Total period births (model scale)	0.077702	0.087911	0.088739
Households (model scale)	0.931745	1.015384	1.022162
Persons (model scale)	2.325267	2.549353	2.567515
Total rooms (model scale)	6.274105	6.727506	6.437250

Fertility: rebating the existing tax raises period fertility by 4.12%. The higher tax with rebate raises it by 4.52% relative to the unrebated baseline, or 0.38% relative to the already rebated 1% case.

Housing: total rooms increase, but households increase faster, so rooms per household fall. Ownership changes are small. This comparison does not establish an improvement in housing allocation.

Checks: all three stationary equilibria pass housing clearance, pension balance, household feasibility and exact reproduction. Both rebate budgets balance separately. The standard 17 diagnostic figures are retained for every case.

Scope: long-run stationary comparisons under the retained diagnostic demographic and entry closure. These are not impacts from the inherited 2023 economy. The historical patch still fails terminal-distance certification. Population and total-birth levels use the retained model normalization; period fertility is distinct from total births.

Specification: annual tax rates 1%, 1%, 2%; equal per-household rebate where shown; payroll tax 17.9%; housing supply elasticity 0.63; fertility preference 0.1023951452. Monetary flows cover the four-year model period. Source jobs: 17499515, 17499516, 17499517. Full receipts and inputs: stationary_policy_comparison_fit/contract.json and results/.
