

Estate-recipient diagnostic

Purpose and experimental design

The reference is the September 25 low-tax selected calibration. Its control, net-valuation, and net-valuation-plus-transfer cases hold preferences, B15 earnings, entrant wealth, other transfers/floors, housing supply and targets fixed. These experiments retain normalized population composition; they are not recalibrated or adopted specifications.

The control values estates as $\max(b' + qh, 0)$; both treatments use $\text{net} = \max(b' + (1 - \text{psi}) qh, 0)$. Financial wealth b' already includes debt. Selling-cost psi is distinct from fertility preference psi_child . All cases retain the same entrant wealth distribution and fixed preferences. There are no age-18 transfers. In the receiving case, anticipated equal payments go to the four-year grid ages 46, 50, 54, 58, and 62.

The inherited experimental payroll-tax rate is 8.751%, not a newly adopted fiscal rule. Population composition is normalized; the birth-entry gap is reported below and is not a certification of closed reproduction. The gross estate-flow observer and its target definition are unchanged across cases; net accounting is supplemental.

Compact case summary

Case	Loss	Net estates / period	Paid / period	Transfer / recipient / period	Transfer / year	Recipient mass	Gross estates / year	Market residual	Birth-entry gap	House price
control	280.411	0.109	0.000	0.000	0.000	0.309	0.031	4.04e-06	1.43e-07	0.613
net_valuation	281.190	0.115	0.000	0.000	0.000	0.309	0.032	1.22e-05	1.60e-04	0.613
net_valuation_transfer	506.158	0.119	0.119	0.385	0.096	0.309	0.033	1.13e-12	0.026	0.626

Estate flows are per normalized household population; the transfer is per eligible recipient. All money amounts use model income units. Annual equivalents divide four-year amounts by four. Gross-flow measurement is unchanged; its level can respond to household choices. Equal payments exhaust net estates only in the receiving case. The other two cases retain an estate outflow.

All target moments: common units across cases

Provenance and caveats

All values are read from completed receipts, target-fit CSVs, parameter CSVs, and saved standard diagnostics. Retained measurement approximations include the native first-birth housing observer versus the empirical event-study estimator, the recent-parent residence proxy, and all-positive estates versus the child-directed empirical target. The inherited loss does not decide which estate closure is appropriate. Transfers are deterministic and pooled; there is no parent-child matching or inheritance risk. These are fixed-preference effects under normalized entry composition, not recalibrated policy effects.

Observed entry wealth is a stock containing prior saving and any prior assistance; later inheritance is a separate flow. This experiment funds the later receipts from net deaths, while entry wealth remains externally supplied. It does not close the full intergenerational wealth account or adopt the separate common-scale entry candidate. Modeling a pre-entry grant would require separating and funding that component of observed entry wealth, rather than adding it twice. A future transition must update the estate pool and recipient mass each date; changing cohort entry also changes aggregate entrant resources even with a fixed per-entrant wealth law.

Run completion status: `exact_three_case_loop_complete`. The stable figures are reproduced one image per landscape page. Income-state legends are compactly formatted from the saved solutions, with plotted data preserved. Input fingerprints and report counts are recorded in the adjacent JSON sidecar; visual review is recorded separately.

Mechanical scale of an entry-only allocation

Dividing the saved period estate pool by the saved flow of entering households gives the one-time grant each entrant would receive if that pool were allocated entirely at entry. The grant is a wealth stock in units of average annual gross working earnings. It must not be divided by four. This calculation holds estate generation and entrant flow fixed; changing the recipient rule would also change saving, fertility and prices. No entry-only equilibrium is solved here.

Case supplying the pool	Entrants / period	Gross pool / entrant	Net pool / entrant
control	0.062	2.003	1.770
net_valuation	0.062	2.063	1.858
net_valuation_transfer	0.062	2.138	1.926
