

Housing and population, 2007-2023

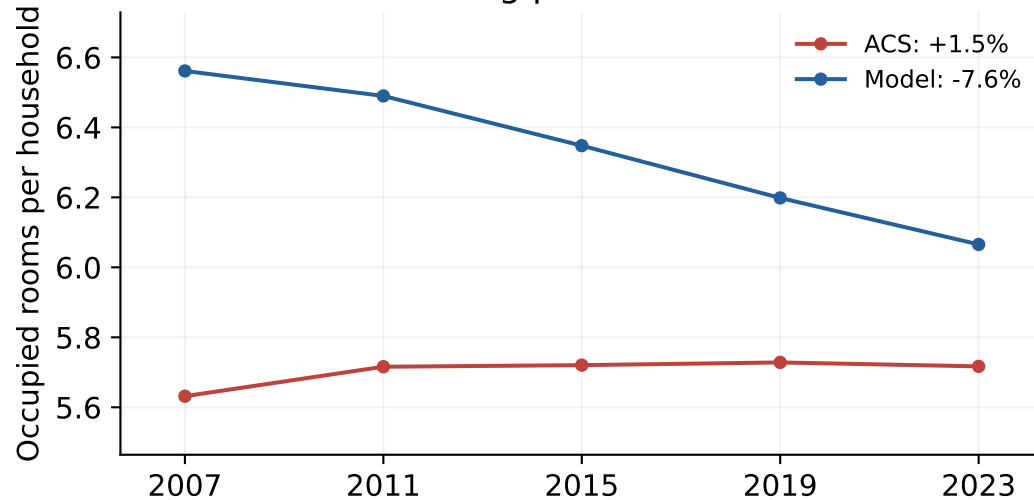

What grew in the data?

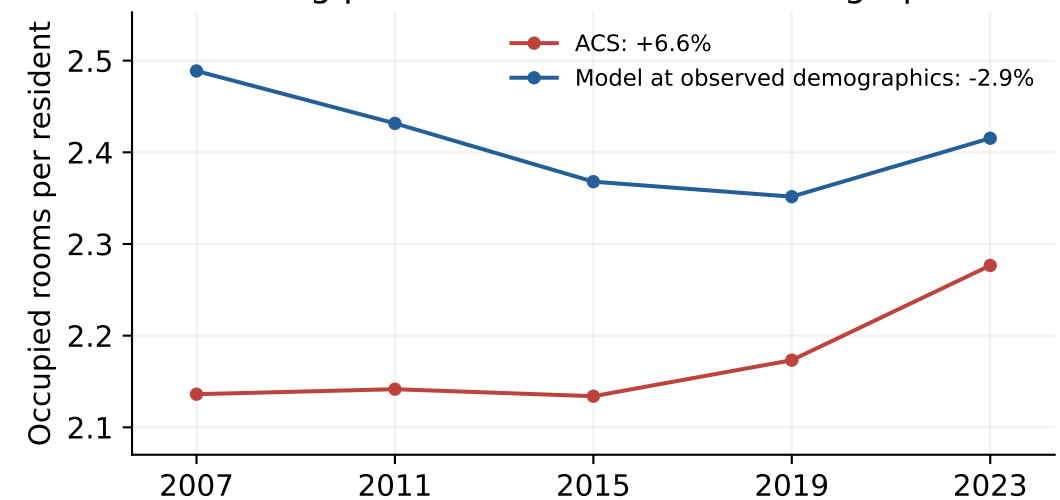

Residents per household

Housing per household

Housing per resident: common demographics

National ACS: the same occupied households and their residents in every measure; heads ages 18-85, rooms capped at nine. Rooms and households use household weights; residents use person weights. Group quarters are excluded.
 Bottom right: model rooms per household $\times$ observed households / observed residents. This holds demographics common; it is not a model population prediction. The retained model has no separate resident-person history before 2023.
